# Intern intake requirements

I am in the process of automating some of the trivial tasks in social media management which eat up a large amount of employee's time and decrease productivity. Most of the tasks that I plan on automating are mundane tasks, which require very little human interference and can be automated to free up employee's time.

Bots I plan on making or have been working on:

1) Instagram followers, following scraper and user follower

Instagram bio, username, f&f count, post count, display pic and url scraper for followers & following

Go through the scraped data and shortlist accounts to follow, delete useless accounts(can be done on excel too with a small VBA script)

A selenium bot or a python bot to follow the accounts shortlisted in the last step.

2) Facebook Group finder, Joiner, poster

The process that I have right now is basic and mostly manual. Also we have to depend on some external poster(e.g. rkposter) for posting in groups. Group finder is entirely manual, group joiner is botted using touch macro script and works only with Memu emulator. Group poster is entirely app. I need someone to create a bot using Selenium for FB group finder and joiner.

The intern should have good knowledge of Selenium and/or python. Basic understanding of HTML/CSS.
